Sprint 4 Burndown Chart

Sprint 4 Analysis

Problems

The team was severely set behind this week because all team members were preoccupied with other assessments. All members were focused heavily CSCC01's Assignment 2 until late Saturday evening (Even then, some members were not finished in time.) Sam and Andrew were further preoccupied by CSCB36's Term Test 2.

Close Analysis

At the end of Sprint 2, we noticed that our progress was slightly delayed, as we had spent a large amount of time in the first two sprints researching how to use various APIs, Lucene, Tomcat, HTML/CSS, SQL etc and building starter code.

In Sprint 3, we spent a lot of time working on redesigning our project structure based on TA recommendations, and catching up with the goal of having a working project to demo by the end of Sprint 4.

This week, however, everyone was busy working on assignment 2, and/or other assessments in other courses, and most of the team was forced to pull all-nighters between Thursday and Saturday night to finish A2 and study for assessments in other courses.

Because of hectic nature of this week, and a collective exhaustion by Saturday night. we were unable to allot sufficient time to complete all the tasks that we had initially hoped would be done by the end of the sprint.

In this sprint, Andrew and Sam were able to make progress on implementing the Lucene functions, and parsing web searches for the results page pages. Kara complete the sign in/sign up page, menu bar, and connect external sites. Kee completed implementing file upload and all database insert/select/delete queries.
